## MANHOLE SIZING RECOMMENDATIONS

## Introduction

Round manholes are the most widely used maintenance utility structures that provide access to pipelines for inspection and cleanout. Manholes are used for connecting two or more converging storm or sanitary sewers, permitting pipe size changes, accommodating abrupt changes in alignment or grade and allowing for direct surface flow interception. The largest impact on the size of these structures is the diameter and angle of entrance of the intersecting pipe.

This document provides a guideline for sizing round manhole structures for various sizes and angles of incoming pipe.

## Sizing Considerations

Two main criteria in designing manholes are that they must be large enough to accept the maximum pipe size, and the minimum structural leg width between pipe holes must be maintained.

The minimum pipe opening is assumed to be the pipe's inside diameter plus the wall thickness. The minimum structural leg is, as a practical minimum, 6 inches. Anything less than this width may allow cracking, which can lead to leakage, structural distress or durability concerns. This minimum value may need to be increased based on specific experience or anticipated handling conditions. In those cases a general guide has been to designate the interior structural dimension to be equal to the manhole wall thickness.

A typical additional over-sizing of no more than 6 inches larger than the outside diameter of the pipe is used for the cutout. The final cutout or opening, therefore, includes all of these design provisions with respect to all other pipe openings, relative pipe elevations and vertical clearances.

The type of pipe entering the structure, and the connection method (boot, compression or mortar) must be known to accurately determine the required holes size and consequently, the manhole size.

When possible, avoid pipes entering into structure joints and corners, as this may compromise the structural integrity and watertightness of the structure. However, this practice may be necessary for certain installations and should be left to the discretion of an experienced precast concrete manufacturer.

Always consult your local precast concrete manufacturer and connector supplier for exact design requirements and product specifications.

National Precast Concrete Association

## Design Method

The following method can be used to determine minimum manhole size for as many as three incoming pipes. The analysis assumes a conservative assumption of all the openings to be at the same springline elevation. (For installations where more than three pipes enter a manhole, the design equations in the Appendix must be used. )

Note: Always consult your local precast concrete manufacturer for exact design requirements and manhole size availability. Additionally, when pipe-to-manhole connections use resilient rubber connectors, additional manhole sizing considerations may be required to meet structural and sealing performance expectations.

The formulas are:

- One Pipe: $180^{\circ}>\mathrm{K}$
- Two Pipes: $180^{\circ}>\mathrm{X}^{\circ}>\left(\mathrm{K}_{1}+\mathrm{K}_{2}\right) / 2$
- Three Pipes: $180^{\circ}>X^{\circ}>\left(K_{1}+K_{2}\right) / 2$ and

$$
\mathrm{X}^{\circ}+\left(\mathrm{K}_{2}+\mathrm{K}_{3}\right) / 2<\mathrm{Y}^{\circ}<360^{\circ}-\left(\mathrm{K}_{1}+\mathrm{K}_{3}\right) / 2
$$

Where $\mathbf{K}$ represents the $\mathbf{K}$ Factor that can be found in the tables that follow for different types of pipe.
$X^{\circ}$ and $Y^{\circ}$ are the angles between the pipes with respect to the reference pipe, measured at the pipe centerlines.

Opening in manhole $=$ Pipe O.D. $+6^{\prime \prime}$

## REINFORCED CONCRETE PIPE AND HDPE PIPE K FACTORS

| Pipe Diameter (in) | Pipe Wall Thickness (in) | Manhole Diameter (inches) |  |  |  |  |  |  |

## Design Tables

Since the wall thickness for the design of reinforced concrete pipe and high-density polyethylene pipe are similar, a standard precast concrete C-wall pipe thickness was used for the development of the tables for these products. For inlet pipes, which have greater total outside diameters than standard ASTM C76 C-wall pipes, you must use the design equations in the Appendix to determine the acceptable manhole diameter.

Similarly, if an internal distance between openings is required to be greater than 6 " use the design equations to calculate " $K$ ".

The design tables for PVC and ductile iron pipe were based on the outside pipe diameters specified in the AWWA C150 standards for ductile iron pipe. Profile wall PVC pipe that does not conform to the maximum ductile iron outside diameters may need to use either the RCP/HDPE or corrugated metal tables depending on which is closer to its cross-sectional thickness.

The corrugated metal pipe tables were developed using a 0.064 wall thickness and a 0.5 -inch corrugation pattern for all sizes. Since there are a great number of corrugation depths available for this product, the designer should adjust the design values in the table accordingly.

The equations presented in the Appendix of this document are simplified in the tables as previously noted for each pipe type. These tables are used to determine the minimum size manhole required for one, two and three pipes entering a single manhole structure at various angles. The "K" factors are based on the pipe diameter including its wall thickness
and an appropriate supporting wall between the entering pipe for each manhole diameter. Maximum vertical cutoffs are limited to an 8 -foot high riser.

## Example

Given: Two pipes entering a manhole: 42-inch RCP and 36-inch PVC at $115^{\circ}$

Find: Smallest size manhole
Solution: For two pipes $180^{\circ}>115^{\circ}>\left(K_{1}+K_{2}\right) / 2$
Trial 1 (60-inch manhole) $K_{1}$ (42-inch RCP)=166 (from RCPTable) $\mathrm{K}_{2}$ (36-inch PVC) $=107$ (from PVC Table) $(166+107) / 2=137>115$

## Result: Not Acceptable

Trial 2 (72-inch manhole) $\quad \mathrm{K}_{1}$ (42-inch RCP)=118 (from RCPTable)
$\mathrm{K}_{2}$ (36-inch PVC)=85 (from PVC Table)
$(118+85) / 2=102<115$
Result: Acceptable

## Summary

The procedures presented in this document provide a quick and easy solution for estimating the optimal size for manholes depending on the incoming pipe and type of connections being used. The ultimate design is the responsibility of the engineer, who must ensure the angles are correct. The contractor must also confirm these angles in the field.

## APPENDIX

The determination of acceptability of each entering pipe relative to all the other incoming pipe is based on the reference pipe, which is arbitrarily selected by the designer. For ease of design, it is best to use the largest pipe diameter as the reference pipe. The other incoming pipe are determined by their angle, X and Y , to this reference pipe. The illustration below and corresponding equations are used for making these calculations:

## Variables:

$r$ : manhole internal radius (inches)
S: minimum structural leg, which must be 6 in. or greater (inches)
$P_{A}, P_{B}, P_{C}$ : penetration in manhole to accommodate specified pipe (inches)

Pipe Penetration Equation:
$P_{A}, P_{B}, P_{C}=$ pipe O.D. +6 inches
Note: Pipe outside diameter must also be given in inches.
Pipe A
(Reference Pipe) q $^{\text {. }}$

Pipe C $\varepsilon$

## DESIGN PARAMETERS FORTHREE PIPES

| Pipe Penetration in Manhole | Pipe Angle with <br> Respect to Reference Point | Pipe Angle Equations |  | Final Angle | Allowable Angle Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Initial Angle | Additional Angle to Account for Structural Leg |  |  |
| Pipe A (Reference Pipe) | $0^{\circ}$ | $a^{\circ}=2 \times \sin ^{-1}\left(\frac{0.5 \times P_{A}}{r}\right)$ | $\Phi_{a}{ }^{\circ}=\frac{S \times 180^{\circ}}{\pi \times r}$ | $A^{\circ}=a^{\circ}+\Phi_{a}{ }^{\circ}$ | $A^{\circ}<180^{\circ}$ |
| Pipe B | $\mathrm{X}^{\circ}$ | $b^{\circ}=2 \times \sin ^{-1}\left(\frac{0.5 \times P_{B}}{r}\right)$ | $\Phi_{b}{ }^{\circ}=\frac{S \times 180^{\circ}}{\pi \times r}$ | $B^{\circ}=b^{\circ}+\Phi^{\circ}{ }^{\circ}$ | $X^{\circ}-\frac{B^{\circ}}{2}>\frac{A^{\circ}}{2}$ |
| Pipe C | $Y^{\circ}$ | $c^{\circ}=2 x \sin ^{-1}\left(\frac{0.5 \times P_{C}}{r}\right)$ | $\Phi_{C}{ }^{\circ}=\frac{S \times 180^{\circ}}{\pi x r}$ | $C^{\circ}=c^{\circ}+\Phi_{c}{ }^{\circ}$ | $\begin{gathered} Y^{\circ}-\frac{C^{\circ}}{2}>X^{\circ}+\frac{B^{\circ}}{2} \\ Y^{\circ}+\frac{C^{\circ}}{2}<360^{\circ}-\frac{A^{\circ}}{2} \end{gathered}$ |

DESIGN PARAMETERS FOR FOUR PIPES

| Pipe <br> Penetration in Manhole | Pipe Angle with <br> Respect to Reference Point | Pipe Angle Equations |  | Final Angle | Allowable <br> Angle Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Initial Angle | Additional Angle to Account for Structural Leg |  |  |
| Pipe A (Reference Pipe) | $0^{\circ}$ | $a^{\circ}=2 x \sin ^{-1}\left(\frac{0.5 \times P_{A}}{r}\right)$ | $\Phi_{a}{ }^{\circ}=\frac{S \times 180^{\circ}}{\pi \times r}$ | $A^{\circ}=a^{\circ}+\Phi_{a}{ }^{\circ}$ | $A^{\circ}<180^{\circ}$ |
| Pipe B | $\mathrm{X}^{\circ}$ | $b^{\circ}=2 \times \sin ^{-1}\left(\frac{0.5 \times P_{B}}{r}\right)$ | $\Phi_{b}{ }^{\circ}=\frac{S \times 180^{\circ}}{\pi \times r}$ | $B^{\circ}=b^{\circ}+\Phi_{b}{ }^{\circ}$ | $X^{\circ}-\frac{B^{\circ}}{2}>\frac{A^{\circ}}{2}$ |
| Pipe C | $Y^{\circ}$ | $c^{\circ}=2 \times \sin ^{-1}\left(\frac{0.5 \times P_{\mathcal{C}}}{r}\right)$ | $\Phi_{C}{ }^{\circ}=\frac{S x 180^{\circ}}{\pi x r}$ | $C^{\circ}=c^{\circ}+\Phi_{c}{ }^{\circ}$ | $Y^{\circ}-\frac{C^{\circ}}{2}>X^{\circ}+\frac{B^{\circ}}{2}$ |
| Pipe D | $Z^{\circ}$ | $d^{\circ}=2 \times \sin ^{-1}\left(\frac{0.5 \times P_{D}}{r}\right)$ | $\Phi_{d^{\circ}}=\frac{S \times 180^{\circ}}{\pi x r}$ | $D^{\circ}=d^{\circ}+\Phi_{d}{ }^{\circ}$ | $\begin{gathered} Z^{\circ}-\frac{D^{\circ}}{2}>Y^{\circ}+\frac{C^{\circ}}{2} \\ \text { and } \\ Z^{\circ}+\frac{D^{\circ}}{2}<360^{\circ}-\frac{A^{\circ}}{2} \end{gathered}$ |

NOTE: Pipe $D$ is not displayed on the diagram on page 4, but it would follow the same convention as Pipe A, Pipe $B$ and Pipe $C$ that are displayed on the diagram.
