

Tight Timeline and Job Site No Match for Precast Concrete

Photos courtesy of Jensen Precast

Challenge: An event venue near Lake Tahoe needed to upgrade its gravity grease interceptor system to meet increasing demands. The project team was up against a condensed timeline and several site restrictions due to the location of the previous system.

Solution: The new system featured a durable precast concrete tank and was designed to accommodate existing on-site fixtures. The entire project was completed in just three weeks thanks to precast's local availability and quick, no-hassle installation.

Watertight: Precast tanks are designed, manufactured and assembled to be watertight. Additional watertightness testing ensures proper wastewater treatment inside the tank while protecting the surrounding environment.

Locally Available: Precast concrete tanks are manufactured throughout all 50 states and Canada. No matter where you are or what you need, you can rely on these producers for quality products while supporting your local economy.

Quality-Engineered: Precast tanks are designed and engineered to the latest industry standards, use quality raw materials and are manufactured in accordance with strict QA/QC programs.
